Confirmation No.: 7821

## REMARKS

Claims 33 and 63 have been amended to obviate the objection thereto.

The claims of the application remain rejected under 35 U.S.C. 103(a) as being unpatentable over the combination of the Siegmund, Yoshida and Kurtzer references, with dependent claims being rejected in combination of these references with the Woodard, Eastman, Strack, Jones or Kishi references.

Applicants respectfully traverse the rejection of the claims and note the following for consideration. The invention relates primarily to a small diameter endoscope for use in orthopedic imaging. The independent claims have been amended to clarify the use of a concentric illumination channel or waveguide that can be detached from the handle using a connector mechanism. The reference cited by the Office Action disclosing a small diameter device is Yoshida. With respect to Siegmund, only conventional sized devices have lengths of 30-40 centimeters as indicated at Col. 1, line 35. The length of the probe is now recited in Claim 1 (see page 16, line 2 of the application) to better distinguish over Siegmund. Thus, it would not be obvious to successfully reduce

the diameter of the components needed to provide a suitable image at reasonable cost.

Yoshida is a simple fiber optic device that does not use a distal lens for magnification, apparently providing a simple contact image (see FIG. 8) for dental or blood vessel applications. There is simply no teaching in Yoshida or the other references to add the features of the larger system in Siegmund or Kurtzer, for example, in a small diameter device. Previously, it was thought that the loss in image size and resolution for small diameter devices would compromise the diagnostic value of small diameter systems. Applicants submit that it would not be obvious to combine the recited features in a small diameter orthopedic imaging device. Reconsideration is respectfully requested.
